Snapshot: 35 projects | 5 publications | 138 citations

Experience

- PhD Student, University of Basel (2022-09 - present)
 - Researches continual learning, variational inference, and robust optimization methods.
 - Builds evaluation pipelines that connect theoretical guarantees with operational constraints.

Program Map

- Mathematical Structure for Reliable Learning: Uses spectral and geometric structure to keep optimization behavior stable and
- Social Interaction and Counterspeech: Studies harmful and protective speech interactions to support practical harm-reduction
- Data-Driven Urban Logistics: Models city micro-regions so sustainability transitions can be evaluated as operational decisions.

Selected Work

- Project: bis-continual-process-automation-demo - Process optimisation intake automation: charter + process maps + exportable
- Project: CL-PLO - Experimental sandbox for continual learning policy optimization strategies.
- Project: KumarNavish.github.io - Portfolio website rendered from generated public APIs and operations telemetry.
- Publication: Interaction dynamics between hate and counter users on Twitter (Proceedings of the 7th ACM IKDD CoDS and 29th
- Publication: Normalized laplacians for gain graphs (arXiv preprint arXiv:2009.13788, 2020) - citations: 4
- Publication: Bounds for the extremal eigenvalues of gain Laplacian matrices (Linear Algebra and its Applications, 2021) - citations: 1
